

Day 1 : Overview of Peripherals Theory

Task 1 : Create a table listing 3 types of printers, 2 types of scanners, and 2 types of webcams, and for each, write one real-life use case (for example: 'Inkjet printer – printing college assignments').

Device	Type	Real-Life Use
Printer	Inkjet Printer	Used for printing college assignments, photos, and documents at home.
Printer	Laser Printer	Used in offices for printing a large number of documents quickly.
Printer	3D Printer	Used to create 3D models, prototypes, and small machine parts.
Scanner	Flatbed Scanner	Used to scan documents, certificates, and photographs into a computer.
Scanner	Handheld Scanner	Used to scan small documents or pages when a normal scanner is not available.
Webcam	USB Webcam	Used for online classes, video calls, and meetings on a computer.
Webcam	Built-in Webcam	Used in laptops for video calls, online meetings, and face-to-face communication.

Task 2 : Draw a labeled diagram showing how a typical home printer connects to a laptop or PC, including the connection interface used (USB, Wi-Fi, or Bluetooth).

- Connect the printer to the laptop or PC using a **USB cable**.
- Plug one end of the cable into the computer's **USB port**.
- Connect the other end to the printer's **USB port**.
- Turn **ON the printer** and wait for the computer to detect it.
- Install the printer **driver** if it is not already installed.
- Select the printer from the computer and send the document for **printing**.

Task 3 : List three different connection interfaces (such as USB, Wi-Fi, Bluetooth) used by peripherals like printers, scanners, and webcams, and for each, name one advantage and one disadvantage.

Connection Interface	Advantage	Disadvantage
USB	It provides a fast and stable connection and is easy to set up.	It requires a physical cable, which can make the setup less flexible.
Wi-Fi	No cable is required, and multiple devices can use the same printer over the network.	It depends on the Wi-Fi network, so a weak or disconnected network can affect the connection.
Bluetooth	It is wireless and convenient for connecting devices over a short distance.	It has a limited range and is generally slower than a direct USB connection.

USB:

It is commonly used to connect printers, scanners, webcams, keyboards, and other devices directly to a computer.

Wi-Fi:

It is mainly useful for wireless printers and other network devices because multiple computers can access the same device.

Bluetooth:

It is useful for short-distance wireless connections, such as connecting a keyboard, mouse, or other peripheral device to a computer.

Task 4 : Pick any one device you use at home or college (printer, scanner, or webcam). Write step-by-step instructions for how you would connect it to your computer, including what cable or wireless method you would use and any setup steps required.

Steps to Connect a Webcam

1. Check the Webcam:

First, check the webcam and make sure its USB cable and connector are in good condition.

2. Connect the USB Cable:

Connect the webcam's USB cable to an available USB port on the computer.

3. Wait for Detection:

After connecting it, the computer will automatically detect the webcam. Modern operating systems usually install the required driver automatically.

4. Install the Driver if Required:

If the webcam is not detected automatically, install the driver provided by the manufacturer. Restart the computer if required.

5. Check Camera Settings:

Open the computer's **Settings → Privacy & Security → Camera** and make sure camera access is enabled.

6. Test the Webcam:

Open the Camera application on the computer and check whether the webcam is showing a clear video.

7. Use the Webcam:

The webcam is now ready to use with applications such as video calling, online meeting, or recording software.

Connection Method

The webcam is connected using a **USB cable**. USB provides both communication between the webcam and computer and, in most cases, power to the webcam.
