

Day 3 : Peripheral Troubleshooting Theory

Task 1 : List 5 common issues users face with USB keyboards or mice on laptops, and write one possible solution for each.

No.	Common Issue	Possible Solution
1	Keyboard or mouse is not detected	Disconnect it and reconnect it to another USB port.
2	Keyboard or mouse stops working suddenly	Restart the laptop and check the USB connection.
3	Some keys or mouse buttons do not work	Clean the device and check for physical damage.
4	Mouse cursor moves slowly or irregularly	Clean the mouse sensor and try using it on a proper surface.
5	USB device keeps disconnecting	Try another USB port and update the USB/device drivers.

Task 2 : Simulate a troubleshooting flow: Your Bluetooth headphones are not connecting to your phone. Write the exact step-by-step actions you would take to diagnose and fix the issue, mentioning any settings or indicators you would check.

Troubleshooting Bluetooth Headphones Not Connecting to a Phone

1. Check the headphones

First, I would make sure the headphones are powered on and have enough battery. I would check whether the power or Bluetooth indicator is turned on.

2. Turn Bluetooth ON

I would open **Settings** → **Bluetooth** on my phone and make sure Bluetooth is enabled.

3. Put headphones in pairing mode

I would press and hold the **Power/Bluetooth button** on the headphones until the Bluetooth indicator starts blinking. This means the headphones are ready to pair.

4. Check the available devices

I would look at the Bluetooth device list on my phone and check whether the headphone name appears. I would tap the headphone name to connect.

5. Check if they are connected to another device

If the headphones do not connect, I would check whether they are already connected to another phone, laptop, or tablet. I would disconnect them from that device.

6. Forget and reconnect the device

If the headphones appear in the phone's saved Bluetooth devices but do not connect, I would select them and choose **Forget/Unpair**. Then I would put the headphones back into pairing mode and pair them again.

7. Restart both devices

I would turn Bluetooth off and on again, then restart both the phone and headphones.

8. Reset the headphones

If the problem still continues, I would perform a **factory reset** of the headphones using the manufacturer's reset procedure and try pairing again.

9. Check the final indicators

Finally, I would check that the headphones show **Connected** in the phone's Bluetooth settings and that the headphones' Bluetooth indicator shows a successful connection. I would play some audio to confirm that sound is coming through the headphones.

Task 3 : A user reports that their external webcam is not detected during a Zoom call on Windows 10. Write a checklist of 6 things to check or try to resolve the problem.

External Webcam Not Detected in Zoom – Troubleshooting Checklist

- ✓ **Check the USB connection:** Disconnect the webcam and connect it to another USB port. Check if any power/indicator light turns on.
- ✓ **Check Device Manager:** Right-click **Start → Device Manager** and look under **Cameras, Imaging devices, or Sound, video and game controllers**. Check whether the webcam appears or has a warning icon.
- ✓ **Update or reinstall the driver:** In Device Manager, right-click the webcam and select **Update driver**. If necessary, uninstall the device and reconnect the webcam so Windows can reinstall it.
- ✓ **Check Windows privacy settings:** Go to **Settings → Privacy → Camera** and make sure **Allow apps to access your camera** is turned ON.
- ✓ **Allow Zoom to use the camera:** In the same Camera privacy settings, make sure desktop apps are allowed to access the camera. Then open Zoom and select the external webcam under **Settings → Video → Camera**.
- ✓ **Close other apps and restart:** Close apps such as Teams, Skype, Camera, or browser tabs that may be using the webcam. Restart Zoom and, if needed, restart Windows and test the webcam again.

Task 4 : You are helping a friend whose printer is showing 'offline' status on their PC. Describe how you would use the Windows Troubleshooter tool to try to fix the issue, and explain what information the tool provides during the process.

Using Windows Troubleshooter to Fix an Offline Printer

If a printer is showing “**Offline**” on a Windows PC, I would use the built-in printer troubleshooter to find and fix the problem.

Steps:

1. Open **Settings** from the Start menu.
2. Go to **Update & Security → Troubleshoot → Additional troubleshooters**.
3. Select **Printer** and click **Run the troubleshooter**.
4. Windows will automatically check the printer and its connection.
5. If multiple printers are available, select the printer showing **Offline**.
6. Follow the instructions shown by the troubleshooter and allow Windows to apply any recommended fixes.
7. After troubleshooting, try printing a **test page** to check whether the printer is working.

Information Provided by the Troubleshooter

During the process, the tool can provide information about:

- Whether Windows can detect the printer.
- Problems with the **printer connection**.
- Printer being set as **offline** or unavailable.
- **Print Spooler** service problems.
- Driver or configuration issues.
- Recommended fixes and whether Windows successfully applied them.

Conclusion:

The Windows Troubleshooter is useful because it automatically checks common printer problems and provides information about what caused the issue and which fixes were applied.
