

Day 5 : Operating System Information, Windows, Linux, MaOS

Installation and adjust OS Setting

Task 1 : On your Windows laptop or PC, open 'System Information' and take a screenshot showing your OS version, processor, and RAM details.

Task 2 : Download any official Linux distribution ISO (like Ubuntu or Fedora), and use Rufus or BalenaEtcher to create a bootable USB drive for installation.

Creating a Bootable Linux USB Drive

Steps:

1. Download an official **Ubuntu Linux ISO** file from the Ubuntu website.
2. Insert a **USB flash drive (8 GB or larger)** into the computer.
3. Download and open **Rufus**.
4. In Rufus, select the connected USB drive under **Device**.
5. Click **Select** and choose the downloaded Ubuntu ISO file.
6. Keep the default settings and click **Start**.
7. If Rufus asks about writing in ISO Image mode, select **ISO Image mode** and continue.
8. Wait while Rufus copies the Linux ISO files and creates the bootable USB drive.
9. When Rufus shows **READY**, safely eject the USB drive.
10. The USB can now be used to boot a computer and start the Ubuntu installation.

Result

The Ubuntu ISO was successfully written to the USB drive using Rufus. The USB drive is now **bootable** and can be used to start the Linux installation.

Note: Creating the bootable USB does not install Linux on the computer. Installation starts only after booting the computer from the USB.

Task 3 : On a macOS device (or using a macOS virtual machine), open 'System Preferences' and change the desktop wallpaper, then adjust the system language to Hindi or Gujarati.

Changing Desktop Wallpaper and System Language in macOS

Steps:

1. Open **System Preferences** from the Apple menu.
2. Click **Desktop & Screen Saver** and select a different wallpaper from the available options.
3. Return to **System Preferences** and open **Language & Region**.
4. Under **Preferred Languages**, click the **+ (Add)** button.
5. Search for and select **Hindi** or **Gujarati**.
6. Click **Add** and select the new language as the primary language if prompted.
7. macOS may ask you to log out or restart for the language change to take full effect.
8. After logging in again, check that the selected language is being used for the system interface.

Task 4 : Install a fresh copy of Ubuntu Linux (real or virtual machine) and create a new user account named 'gamer'. After installation, enable automatic login for this user and take a screenshot of the login screen showing the username.

Creating a New User Account in Ubuntu

I installed a fresh copy of **Ubuntu Linux in VMware Workstation** and created a new user account named **gamer**.

Steps Performed:

1. I started my Ubuntu virtual machine in **VMware Workstation**.
2. After Ubuntu was installed, I opened **Settings** and went to **System → Users**.
3. I unlocked the Users settings using my administrator password.
4. I clicked **Add User** and created a new user account with the username **gamer**.
5. I set a password for the gamer account and completed the account creation.
6. I selected the **gamer** account and enabled **Automatic Login**.
7. I restarted the Ubuntu virtual machine to check whether the settings were working correctly.
8. I verified that Ubuntu automatically logged in using the **gamer** account.

Result

The **gamer** user account was successfully created in Ubuntu running on VMware Workstation, and automatic login was enabled successfully.

Task 5 : Use ChatGPT to generate a step-by-step guide for installing Windows 10 on a laptop, including partitioning tips and post-installation settings for privacy and updates. Follow the guide and note any steps that were unclear or missing.

Step-by-Step Guide for Installing Windows 10

- I used ChatGPT to create a guide for installing Windows 10 on a laptop.
- The following steps explain the installation, partitioning, and important settings after installation.

1. Prepare the Installation USB

I created a bootable Windows 10 USB using the Windows 10 ISO and a tool such as Rufus. I backed up important files before starting the installation.

2. Boot from the USB

I connected the bootable USB to the laptop, restarted it, and opened the boot menu using the appropriate key. I selected the USB drive as the boot device.

3. Start Windows Setup

I selected the language, time format, and keyboard layout, then clicked **Install Now**.

4. Select the Installation Type

I selected **Custom: Install Windows only** to perform a fresh installation.

5. Partition the Drive

I selected the target drive and created the required partitions. For a fresh installation, I made sure that important data was backed up before deleting or formatting any existing partitions. I left enough space for Windows and future applications.

6. Install Windows

I selected the Windows installation partition and started the installation. The laptop restarted several times while Windows files were copied and installed.

7. Complete Initial Setup

After installation, I selected the region, keyboard layout, network connection, and created the Windows user account.

8. Configure Privacy Settings

During setup, I reviewed privacy options such as **location, diagnostic data, advertising ID, and activity history**. I disabled unnecessary options according to my privacy preference.

9. Install Updates and Drivers

After reaching the desktop, I opened **Settings → Update & Security → Windows Update** and checked for available updates. I also installed the required device drivers.

10. Final Check

I restarted the laptop and checked that the keyboard, touchpad, Wi-Fi, sound, display, and other important hardware were working correctly.

Partitioning Tips

- Back up important files before changing partitions.
- Do not delete recovery or system partitions unless you know they are no longer needed.
- Keep enough space on the Windows partition for updates and applications.
- Use **NTFS** for the Windows installation partition.
- During a clean installation, Windows automatically creates several required system partitions.

Steps That Were Unclear or Missing

- While following the guide, I found that some details can vary depending on the laptop.
- The exact **Boot Menu/BIOS key** is different for different manufacturers.
- The Windows setup screens can also vary slightly between versions.
- Driver installation may also require downloading drivers from the laptop manufacturer's website if Windows Update does not find them.

Result

Windows 10 was installed successfully after preparing the drive, completing the installation, reviewing privacy settings, and installing updates and drivers. The guide was useful, but hardware-specific steps such as the boot key and drivers needed to be checked according to the laptop model.
